Company Representative at the 23rd World Mining Congress:

Tim Connors, Market Manager

Company Profile:

Founded in 1979, Blasch Precision Ceramics is a manufacturer of ceramic shapes for a variety of industries where high temperature, abrasion or corrosion exists in the process. Blasch employs an engineered systems approach to solve customer problems and further improve and prolong the life of ceramic and refractory parts.

Product Line(s):

Blasch serves a variety of manufacturing and processing industries throughout the world, providing innovative, customized solutions for chemically difficult, severe wear or high temperature applications. They manufacture ceramic shapes that often replace costly steel components or replace existing ceramic based products used in the mines, mineral processing, power plants and other markets. One of the biggest costs incurred in the operating of a plant is that of maintenance and repair, particularly of any component that comes into contact with the product or process.

Objectives(s) at the 23rd World Mining Congress:

Blasch is seeking agents and sales representatives with an engineering mindset and approach to selling. Due to the nature of their product, they prefer to work with experts in their respective fields that have experience in selling ceramics or refractory based products. They also like to work with EPCMs and OEMs on new applications or ways to improve their processes.
