Company Representative at the 23rd World Mining Congress:

Paul Devine, International Sales Manager

Company Profile:

Established in 1969, Cemen Tech is a leading manufacturer of mobile volumetric concrete plants. The company sells equipment in over 50 countries throughout the world, supplying parts and services wherever needed. They have been 100% employee-owned since 1993, and all employees are shareholders in the company, taking great pride in the equipment they manufacture.

Product Line(s):

Cemen Tech manufactures, sells and services compact volumetric concrete plants that can be truck, trailer or rail mounted, or used as a stationary plant. Their equipment produces concrete on demand, keeping materials in separate compartments. When in operation, materials (sand, stone, cement, water, and other admixes) are measured and mixed continuously as long as the compartments are supplied. If concrete is no longer needed, the machine is simply stopped and material left over can be used later; there is no waste as with drum mixer transport systems where the entire batch can be lost.

The equipment is extremely accurate, can mix most any type of concrete, and is used almost exclusively when rapid set types of concrete are used.

Cemen Tech offers units with production rates from 15 cubic yards/ hour to 100 cubic yards/hour. Mobile units can carry from 2 cubic yards up to 15 cubic yards.

Objectives(s) at the 23rd World Mining Congress:

Cemen Tech is looking to meet with mining companies, energy companies, and contractors that provide service to the mining and energy sector.
